beyond the case study dilemma in planning research

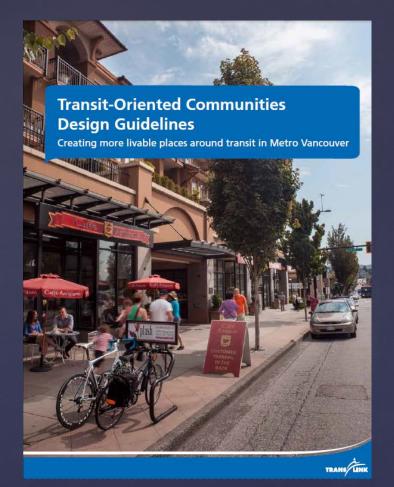

Ren Thomas, iTOD Project 1
Postdoctoral Researcher, University of Amsterdam

- Case studies are widely used in planning theory and practice
- But often done in isolation and don't learn from each other
- Contextual issues can make it difficult to generalize research findings
- Synthesizing case studies findings can be valuable in knowledge development

the case study dilemma

Project 1: Which land use and transport policy measures?	Project 2: Which public-private financial arrangements?	Project 3: Which information and knowledge, and in which form?			
International meta- analysis and case studies; workshops in the NL	International case studies; workshops in the NL	Comparative case studies; workshops in the NL			
Luca Bertolini, Ren Thomas (UVA)	Erwin van der Krabbe, Sander Lenferink (Radboud U Nijmegen)	Dominic Stead, Dorina Pojani, Verena Balz (TU Delft)			

three questions, three projects

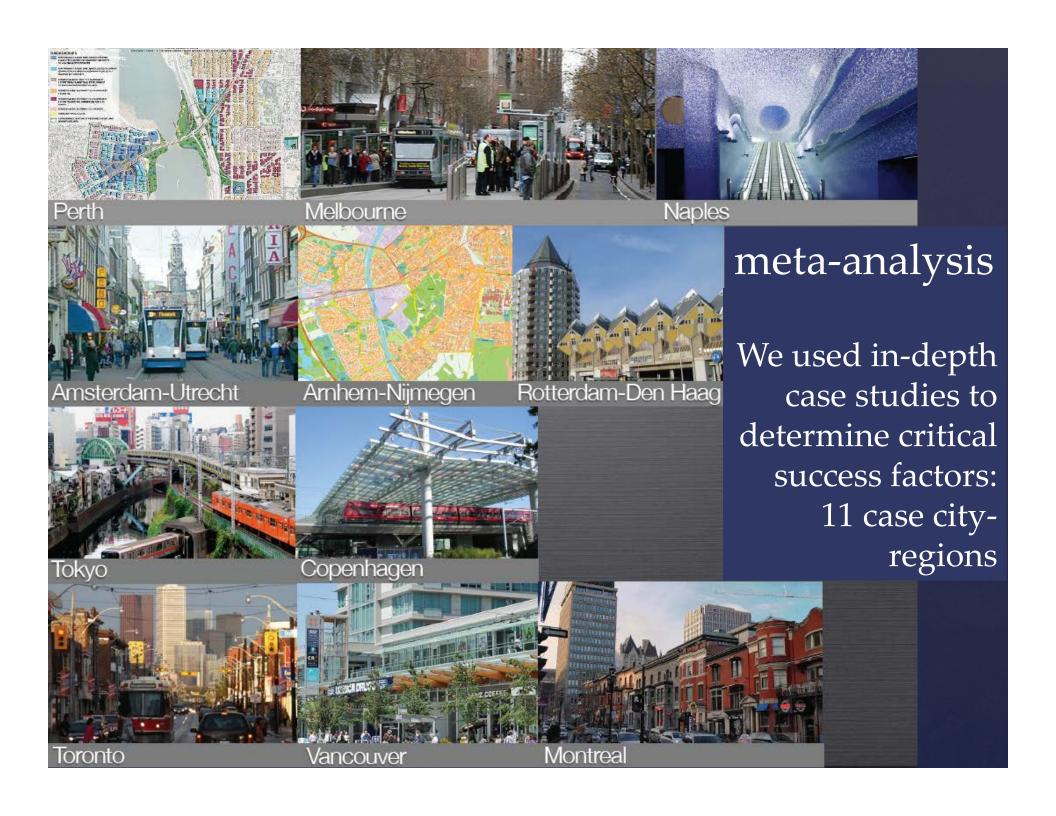

TOD can be described as land use and transportation planning that makes walking, cycling, and transit use convenient and desirable, and that maximizes the efficiency of existing transit services by focusing development around transit stations, stops, and exchanges. TOD can be seen as part of a broader approach to urban development. Successful TOD can be defined as implementation of this type of development at a regional scale.

our definition of TOD

- Phase 1 (July 2012-July 2013) metaanalysis and rough set analysis to determine which policies, actors and institutions are most influential in TOD implementation
- Phase 2 (July 2013-July 2014) workshops with Dutch planners to determine which of these could work in The Netherlands

methodology

- Meta-matrix: created coded case reports, summarized studies in matrix format, noted commonalities and differences between cases (Miles and Huberman 1994)
- Sorted meta-matrix by 5 major themes:
 - · policy consistency
 - actors/roles
 - · land use-transport connections
 - specific tools and policies
 - barriers to TOD
- Identified possible critical success/failure factors for each case

meta-analysis

Plans and Policies

- 1. Consistency in planning policy supporting TOD over time
- 2. Vision stability
- 3. Support of higher levels of government
- 4. Political stability: national
- 5. Political stability: local

Actors

- 5. Relationships between actors
- 6. Presence of a regional transport-land use planning body
- 7. Level of competition among municipalities
- 8. Presence of interdisciplinary teams
- 9. Public participation
- 10.Public acceptance
- 11.Presence of key visionaries

Implementation

- 12.Use of site-specific planning tools (FAR bonuses, leasing of air rights, density targets)
- 13. Corridor-level planning
- 14. Certainty for developers
- 15.Willingness to experiment

critical success factors

Critical Factors in TOD Implementation		Scale									
		1	2	2 3		5					
*		PLANS AND POLICIES									
2	How consistent would you say planning policy has been in supporting TOD over time? (including specific station areas, transit corridors, cycling and pedestrian infrastructure)	Very inconsistent / major changes over time	Mostly inconsistent / a lot of changes over time	No clear consistency / inconsistency	Mostly consistent / a few changes over time	Very consistent / no major changes over time					
3	How stable would you say the vision of the city-region has been over time? (e.g. city-regional vision for land use-transport planning or urban sustainability)	Very unstable / major changes over time	Mostly unstable/a lot of changes over time	Some degree of change in vision	Mostly stable / a few changes over time	Very stable / no major changes over time					
4	How much support is there from higher levels of government for TOD? (e.g. state tax on gasoline to support public transit, national station location or regeneration policy, provincial funding for cycling infrastructure)	No support / no policies or funding	Very little support / very few policies or funding	Some degree of support / some policies or funding	Good support / some policies and funding	Very good support / extensive policies and funding					
5	How stable has the political situation been at the national level?	Very unstable / major changes over time	Mostly unstable/ a lot of changes over time	Some degree of change over time	Mostly stable / a few changes over time	Very stable / no major changes over time					
6	How stable has the political situation been at the local level?	Very unstable / major changes over time	Mostly unstable/ a lot of changes over time	Some degree of change over time	Mostly stable / a few changes over time	Very stable / no major changes over time					
7	Would you like to make any comments to clarify your answers to questions 2-6?					**					

local expert feedback

Convenience and Desirability

Overall convenience and desirability of walking, cycling, and public transit

Efficient Infrastructure

Maximization of efficiency in existing transit services (concentration of development at stations and in corridors)

Overall Success

Aggregate measure

Scale of Implementation

Scale of implementation of TOD across the city-region

Modal Split

Modal split for cycling, walking and public transit in the city and region

performance measures

6)		Scale								
	Performance Measures	1	2	3	4	5				
22	Overall, would you say that your city-region makes public transit convenient and desirable?	No public transit infrastructure / no access to public transit	Very little public transit infrastructure / poor access to public transit	Some public transit infrastructure / average access to public transitin some areas	Good amount of public transit infrastructure / good access to public transit in many areas	Widespread public transit infrastructure / excellent access to public transit across the region				
23	Overall, would you say that your city-region makes cycling convenient and desirable?	No cycling infrastructure / no safe access to cycling	Very little cycling infrastructure / somewhat unsafe access to cycling	Some cycling infrastructure / safe access to cycling in some areas	Good amount of cycling infrastructure / safe access to cycling in many areas	Widespread cycling infrastructure / very safe access to cycling across the region				
23	Overall, would you say that your city-region makes walking convenient and desirable?	No walking infrastructure / no safe access to walking	Very little walking infrastructure / not very safe access to walking	Some walking infrastructure/safe access to walking in some areas	TO SERVICE STREET, SERVICE STREET, STR	Widespread public transit infrastructure / very safe access to walking across the region				
25	What is the modal split for cycling, walking, and public transit in your city? In the region?			•	2	M T				
26	Would you say that your city-region maximizes efficiency of existing transit services by focusing development around public transit stations and corridors?	Not efficient / development not focused around stations or corridors	Not very efficient / little development around stations or corridors	Some degree of efficiency / some development around stations and corridors	Efficient / focused development around stations and corridors	Maximizes efficiency / development very focused around transit stations and corridors				
27	Overall, how would you describe the scale of TOD implementation in your city-region?	No station areas, no public transit corridors	Only one main station area, no public transit corridors	A couple of station areas, no public transit corridors	Some station areas and public transit corridors	Many station areas, many public transit corridors				

- Naples: very unstable political regime and visions, but increased support from the EU and national government in the past 15 years, has used interdisciplinary teams to implement TOD
- Copenhagen: consistent vision, but intense competition between municipalities, lack of sitespecific tools, instability in policy supporting TOD
- Perth: better relationships between actors, cultivated public acceptance of higher densities, mixed-use development and TOD, very willing to experiment, but sector-specific teams have led to TOD that focuses on car-rail integration

examples

- The meta-matrix allowed a structured analysis of each case and led to insights on cross-case patterns: CSFs
- Because the factors are important in each case, we start to see some generalizable trends in TOD implementation removing issues of context to arrive at more universal findings
- Next steps: rough set analysis to determine which of the factors are most influential

summary

resence of a regional transport land use planning body

Presence of Key Visionalles Support of higher levels of government Pulitical stability local

Willingness to experiment Relationships between actors

Vision stability

Political stability national
